# **Virginia Grain Sorghum Performance Tests**

## **2013**

Trial conducted by: D. Redd, F. Bryant

Variety Test Coordinators: M. Balota, Ph.D., H. Mehl, Ph.D., L. Rutto, Ph.D.

---

### **INTRODUCTION**

The 2013 grain sorghum OVT tests contained 45 hybrids planted as a full season crop and 22 as double crop. Full season tests were conducted at three locations, at the Tidewater Agricultural Research and Extension Center (TAREC) in Suffolk, VA, in a farmer field near Homeville, VA, in Sussex County, and at the Virginia State University's Randolph Farm near Petersburg, VA. The double crop sorghum trials were conducted at two locations, at the TAREC and in a farmer field near Windsor, VA, in the Isle of Weight County.

### **MATERIALS AND METHODS**

Based on the information provided by the participating companies, hybrids were divided in three maturity groups for the full season and two maturity groups for the double crop. Therefore, the experimental design was a split plot with maturity group as the main split and the hybrids arranged in a randomized complete block design with three replications within each maturity group. In Sussex Co., the main plot was irrigation, sub-plot was maturity group, and sub-sub-plot was genotype. Detailed information on planting, crop maintenance, harvest, and weather are presented within each location, irrigation treatment (where available), and maturity group.

### **RESULTS SUMMARY**

With the exception of plots at Sussex, at all other locations average yields were around 100 bu/A. At Sussex, sorghum was planted after sorghum as previous crop and this in addition to extreme soil moisture conditions changing from very wet to very dry in repeated cycles was probably the cause of much lower yields in comparison with the other three locations. Therefore, little to no credit should be given to the results at this location. A couple of hybrids performed right at or above the average of all hybrids, consistently at TAREC, Petersburg, and Isle of Weight. They are for the full season planted sorghum 86P90, AG2115, DKS37-07, and 86G32 from the early group; DKS44-20, DKS53-67, DKS49-45 83G17, M77GB52, NK6638, NK7633, DKS51-01, and DKS54-00 from the medium group; and TRX15401, 06173, and SP7868 from the late maturing group. In the double crop plantings, the best performing hybrids were M75GB39, AG103, and DKS37-07 for the early group and 3552, GX13661, 5556, and AG3201 for the late maturing group. Some of these hybrids also performed well in previous tests in Virginia. They are DeKalb DKS44-20, DKS53-67, DKS49-45, and DKS54-00; Dyna-Gro M77GB52 and M75GB39; Pioneer 83G17; Sorghum Partners NK6638; Triumph TRX15401; and Richardson Seed 06173.

## GRAIN SORGHUM PERFORMANCE MEASUREMENTS

**Yield:** Yields are calculated from the weight of the threshed grain from each plot and are expressed as bushels per acre (BU/A) at 14% moisture.

**Grain Moisture:** Expressed as percent moisture of grain at harvest.

**Plant Height:** Average height in inches from the soil surface to the top of the grain head.

**% Mold & Anthracnose:** Head mold and anthracnose (when present) were rated between physiological maturity and harvest (mid-September for full season and mid-October for double crop sorghum). The percentage of total grain with signs of fungal colonization was estimated for each plot. When present, anthracnose was rated as the percentage of total leaf area within a plot with lesions characteristics of anthracnose. However, anthracnose incidence and severity was low to absent in the Virginia OVT.

# **North Carolina Grain Sorghum Performance Tests**

## **2013**

Trial conducted by: Leah Boerema

Variety Test coordinator: R. Heiniger, Ph.D.

---

### **INTRODUCTION**

The 2013 North Carolina grain sorghum OVT tests contained 45 hybrids planted full season and 22 hybrids planted as double crop. Full season testing took place at three locations: Cherry Research Farm in Goldsboro, NC; Cunningham Research Station in Kinston, NC; and Upper Coastal Plain Research Station in Rocky Mount, NC. Double crop testing took place at two locations: Cunningham Research Station in Kinston, NC; and Upper Coastal Plain Research Station in Rocky Mount, NC.

### **MATERIALS AND METHODS**

Hybrids were divided into three maturity groups for full season and two maturity groups for double crop. Therefore, the experimental design was a split plot with maturity group as the main split and the hybrids arranged in a randomized complete block design with four replications within each maturity group. Detailed information on planting, crop maintenance, harvest, and weather are presented within each location and maturity group.

### **RESULTS SUMMARY**

Rocky Mount and Goldsboro full season locations received favorable rains and adequate growing conditions. As a result, yields averaged 100 bushels and 90 bushels, respectively. The Kinston location had significant sicklepod pressure that was difficult to control for both the full season and double crop tests. Hybrid performance was variable by location but some of the strongest performing hybrids across full season locations were TRX15401, Pioneer 84P80, Dyna-Gro M77GB52, and DeKalb 51-01. Two of the top yielding hybrids in the double crop tests were DynaGro M77GB52 and Richardson 92123.

## GRAIN SORGHUM PERFORMANCE MEASUREMENTS

**Yield:** Yields are calculated from the weight of the threshed grain from each plot and are expressed as bushels per acre (BU/A) at 13.5% moisture.

**Grain Moisture:** Expressed as percent moisture of grain at harvest.

**Plant Height:** Average height in feet from the soil surface to the base of the grain head.

**Anthracnose, Fusarium Head Blight, and Rough Leaf Spot:** Disease ratings were made on a 1 to 10 scale with 10 having no sign of disease and 1 representing plants with leaves completely covered by disease lesions.

Table 33. Performance of Full Season Grain Sorghum Hybrids, Goldsboro, NC, 2013.

# **South Carolina Grain Sorghum Performance Tests**

## **2013**

TRIAL CONDUCTED BY: C. Myers, J. McCall, A. Crouch, B. Stancil, D. Gunter, and H. Free

VARIETY TEST COORDINATOR: Christopher Ray, Ph.D.

---

### **INTRODUCTION**

The 2013 grain sorghum OVT tests contained 45 hybrids planted as a full season crop and 22 as double crop. Full season tests were conducted at four locations, the Edisto Research and Education Center (Edisto REC) in Blackville, SC, an on-farm test near Newberry, SC, at the Simpson Experiment Station near Pendleton, SC and at the Pee Dee Research and Education Center, Near Florence, SC. The double crop sorghum trials were conducted at two locations, at the Edisto REC and at the Simpson Experiment Station.

### **MATERIALS AND METHODS**

Based on the information provided by the participating companies, hybrids were divided in three maturity groups for the full season and two maturity groups for the double crop. Therefore, the experimental design was a split plot with maturity group as the main split and the hybrids arranged in a randomized complete block design with three replications within each maturity group. Detailed information on planting, crop maintenance, and harvest, are presented within each location and maturity group.

### **RESULTS SUMMARY**

This year trial results were impacted by excessive rainfall during the majority of the growing season. This condition led to inability to properly time field operations such as fertilization and application of pesticides. Yields were lower than expected at the test locations in Newberry and Blackville, SC due to excessive leaching and inability to apply layby nitrogen respectively. Yields at the Pendleton, SC site were lower compared to last year overall but still respectable and representative of what growers can expect in a year with similar growing conditions.

## GRAIN SORGHUM PERFORMANCE MEASUREMENTS

**Yield:** Yields are calculated from the weight of the threshed grain from each plot and are expressed as bushels per acre (BU/A) at 14% moisture.

**Grain Moisture:** Expressed as a percent moisture of grain at harvest.

**Plant Height:** Average height in inches from the soil surface to the top of the grain head.

**Head Extension:** Measurement between the flag leaf and the bottom of the head.
