

Festulolium - Italian type

Early and with Top Yield

- Combining yield and quality
- Fast establishment, High 1st cut yield
- Very early spring growth
- Good resistance to diseases

Meadow Fescue x Italian Ryegrass

PERUN is a tetraploid variety of festulolium, Italian ryegrass type but with better persistence.

Yield and Quality

The yield is high with relatively high sugar contents. PERUN is utilised for silage as pure crop or in mixture with other grasses like perennial ryegrass, tall fescue types of festulolium and red clover. In such mixtures, PERUN participates with high dry matter yield - especially in the 1st and 2nd harvest year - with very good quality.

Promising Trial Results

Official trials in UK have shown very early spring growth and very high yields in the 1st cut. Good resistance to rust, Dreschlera and mildew. Yields under short growing season in Denmark, Canada and USA are also very promising.

	PERUN	Fennema, control
Heading date, days after 1 April	46	59
Early spring growth, % of Fennema	146	1,42 t DM/ha
Conservation yield, % of Fennema	110	16,38 t DM/ha
Spring growth, simulated grazing % of yield	29	23
Rust resistance, 1-9, 9 most resistant	8	7
