

TerraLife®- MaizePro DT

Balanced, partly winter hardy cover crop
for intensive maize crop rotations

MaizePro DT is the ideal mix for corn crop rotations. It selectively supports the formation of mycorrhiza in a corn rotation, and as a result improves the soil structure. The soil becomes more water stable, has an improved bearing capacity and is easier to work. The intensive root penetration properties of the components create new root channels, which help the corn particularly during periods of drought. The hardy components guarantee highly efficient erosion protection right into spring. After a successful cover crop, the soil only requires working to a depth of the soil horizon receiving the corn seed. In this way, the capillarity is maintained, ensuring water availability for germination.

Mixture characteristics:

Preservation of nutrients	+++
Nitrogen fixation	++
Penetration of compacted soils	++
Suitable for late sowing	++
Suitable for cold sites	++
Suitable for warm, dry sites	+++

- ✓ Leaves optimal soil structure
- ✓ Supports deep root growth
- ✓ Very good nitrogen exploitation

Growing instructions:

Crop rotations:

Corn and other cereals

Sowing rate:

35 – 40 lbs/ac

Planting date:

Similar to alfalfa late summer guidelines of your area

Seeding depth:

1/2" to max. 1"

Included species:

Red clover, phacelia, linseed, alsike clover, crimson clover, Persian clover, Egyptian clover, winter rye, sorghum, common vetch, daikon radish, hairy vetch, field pea, sunflower
