

Perseus

Festulolium

A tetraploid rye grass type

Perseus is a crossing between Italian ryegrass and meadow fescue and belongs to the ryegrass type of festulolium. The result is a variety with a very vigorous growth both in spring and after cutting, but at the same time also with a good persistence in USDA zone 4&5.

For cutting purposes

Perseus belongs to the same group of festulolium as Paulita and Perun, but with 4-5 days later head emergence. This makes Perseus very well suited for mixtures for intermediate and late cutting.

Fine forage quality

Perseus has excellent fiber digestibility and sugar content making it a very high quality forage. Excellent for milk and meat production.

At A Glance:

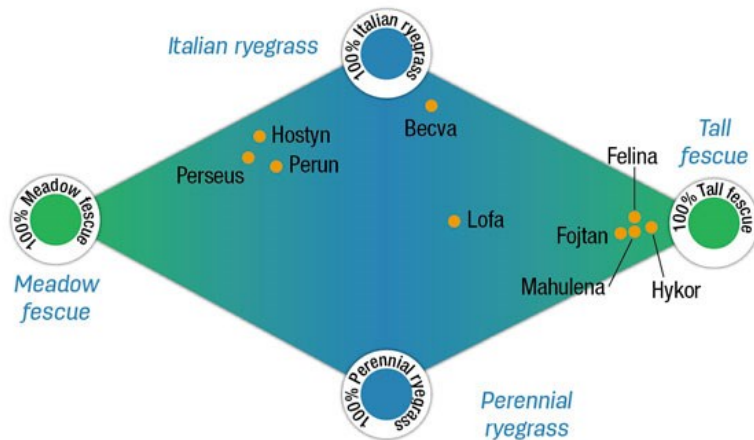

Key Features:

- ◇ Very High Yield
- ◇ High Feeding Value
- ◇ Good Regrowth After Cutting
- ◇ Late Heading
- ◇ Persistent

Establishment:

Seeding Rate: 25-30lbs/Acre
