

Hipast

Festulolium

Hipast = resistance + persistence + digestibility + yield

Fescue Type Festulolium:

Hipast is a persistent festulolium forage grass and with its robust ground cover, density and softness it will suit grazing and silage making.

Resistant and Persistent:

With its high resistance to rust, snow mold and helminthosporium, Hipast has distanced itself from other festuloliums and will not only suit cold areas with its high winter hardiness but also suit excellent in warm, humid areas afflicted by drought periods and diseases.

Yield and Forage Quality:

Hipast is a late festulolium and it delivers fast regrowth and increasing yield year after year. It will not only deliver an exceptional high yield but one of the qualities which Hipast possesses, is the high content of digestible matter in combination with high-energy content

Characteristics and Ratings:

Persistence: 9/9

Rust Tolerance: 6/9

Winter Hardiness: 8/9

Spring Growth (early): 7/9

Ground Cover: 6/9

Grazing Tolerance: 8/9

Mixture adaptation: 8/9

Density: 7/9

At A Glance:

- ◇ High digestibility
- ◇ Increased Yield
- ◇ Persistence
- ◇ Drought Tolerance
- ◇ Resistant to diseases
- ◇ Late Maturity

Seeding rate: 30-40 lbs/acre

	NEL per ha, year 1	NEL per ha, year 2	NEL per ha, year 3
Hipast	118.7	122	110.8
Perennial ryegrass	117.6	98.4	51.3
